

ABSTRACT

The invention provides a structure of decorative panel for inserted-in photographs (or pictures), which includes a panel and a plurality of through holes that have different shapes and are located on the surface of the panel. Besides, the size of each through hole is smaller than that of a photo (or picture) or a picture card so that the main body of the photo (or picture) or the picture card can be displayed therein. In addition, a U-shaped receiving slot is provided at the backside of the panel corresponding to the bottom and two lateral sides of one of the through holes, wherein the receiving slot is for a photo (or picture) or a picture card to be inserted in. Finally, a back panel is to be attached to the backside of the panel so that different photos can be easily inserted into and removed from the panel without applying any glue.
